

1 **SUBJECT:** The Study of the Risks and Benefits of Childhood Vaccines

2

3 **SUBMITTED BY:** William R. Rogers, DO, MPH, FACOFP

4 **REFERRED TO:** Public Affairs Committee

---

5 WHEREAS, the Childhood Vaccine Series in the United States is less voluntary; and

6 WHEREAS, the rate of sudden infant death syndrome, autism, attention deficit disorder,  
7 diabetes types 1 & 2, asthma, food allergies, and other autoimmune disorders are increasing at  
8 an alarming rate in the pediatric population; and

9 WHEREAS, parents refuse to vaccinate their infants, toddlers, and children in fear of adverse  
10 vaccine reactions or excessive immune stimulation with resultant immune system defects; and

11 WHEREAS, pediatricians are refusing to treat pediatric patients whose parents have refused  
12 vaccinations on behalf of their children; and

13 WHEREAS, there has been no published scientific study in the USA that compares vaccinated to  
14 unvaccinated children to verify the risks/benefits of the Childhood Vaccine Series; now,  
15 therefore be it

16 RESOLVED, that the Texas Osteopathic Medical Association (TOMA) requests the Center for  
17 Disease Control and The National Institute of Health perform a retrospective study on health  
18 parameters of fully vaccinated children age 5 versus completely unvaccinated children age 5 to  
19 evaluate the true risk/benefits of the Childhood Vaccine Series.
